Abstract

Keywords: sample; article; author

Content

Text and results for this section, as per the individual journal's instructions for authors. Here, we reference the figure 1 and figure 2 but also the table 1.

Section title

Text for this section...

In this section we examine the growth rate of the mean of Z_0, Z_1 and Z_2. In addition, we examine a common modeling assumption and note the importance of considering the tails of the extinction time T_x in studies of escape dynamics. We will first consider the expected resistant population at vT_x for some $v > 0$, (and temporarily assume $\alpha = 0$)

$$E\big[Z_1(vT_x)\big] = \int_0^{v\wedge 1} Z_0(uT_x)\exp(\lambda_1)\,du.$$

If we assume that sensitive cells follow a deterministic decay $Z_0(t) = xe^{\lambda_0 t}$ and approximate their extinction time as $T_x \approx -\frac{1}{\lambda_0}\log x$, then we can heuristically estimate the expected value as

$$\begin{aligned} &E\big[Z_1(vT_x)\big] \\ &\quad = \frac{\mu}{r}\log x \int_0^{v\wedge 1} x^{1-u}x^{(\lambda_1/r)(v-u)}\,du. \end{aligned} \tag{1}$$

Thus we observe that this expected value is finite for all $v > 0$ (also see [**?**, **?**, **?**, **?**, **?**, **?**]).

Table 1 Sample table title. This is where the description of the table should go

1 Introducción
2 Materiales y métodos
3 Resultados

El HP con nombre Cone/cone-rod dystrophy y código HP:0000548 tiene 55 genes que, al mapearlos en la red de STRING [1] con un umbral de corte superior a 900, quedan 46 nodos y 142 conexiones. La red resultante tiene una transitividad de 0,7888446.
